

How Visibility Gaps Affect Multi-Site Traffic Management Performance

A visibility problem on one project can be easy to miss when every site reports differently. Use this map to compare up to five active projects and identify where reporting, escalation, evidence access and operational oversight are inconsistent across the portfolio.

Step 1 | Add Your Projects

Project **A**:

Project **B**:

Project **C**:

Project **D**:

Project **E**:

Step 2 | Mark the Current Visibility Position

Use the following colour key to complete the visibility table below:

Clear: Consistently available

Partial: Varies by access

Gap: Delayed / fragmented

Visibility Area	Project A	Project B	Project C	Project D	Project E
Reporting Consistency					
Current Site Activity					
Issue Escalation					
Evidence Access					
Safety / Compliance Visibility					
Security Visibility					
Environmental Visibility					
Project Progress Visibility					

Step 3 | Review the Pattern

Where to Start With Multi-Site Management

1 Start with Recurring Gaps

Prioritise areas that are weak across more than one project.

2 Define a Minimum Standard

Agree what every project should provide for the priority area.

3 Assign Ownership

Ensure responsibility for capture, review and escalation is clear.

4 Make Access Consistent

Agree where authorised teams should retrieve the information from.

5 Set a Review Rhythm

Review the portfolio regularly as projects change or move on.

6 Re-run the Map

Repeat the exercise to see whether gaps are minimised.

Priority area to prioritise first:

Minimum info required from every project:
